ADULT TAMAGOTCHI
Interactive Room Design

A mobile life-simulation concept where everyday tools are physical objects inside a hand-drawn 2D world.

Core principle: each location is a complete illustrated scene. Small interactive objects open focused windows while the room remains visible behind them.

This concept document includes initial room views, numbered object maps, and modal-window examples for every interactive object. Illustrations and windows are schematic wireframes, not final production art or a clickable prototype.

1. Core interaction model

The room itself is the primary interface. Players explore a fully drawn environment and tap furniture or objects to open practical tools. Conventional menus are secondary.

Interaction flow

1. Enter room	2. Tap object	3. Open window	4. Save and return
Show the full room and character.	Use a small hit area aligned with the object.	Open a compact panel over the same scene.	Save changes and update the object's visible state.

Window design rules

• **Keep the world present:** dim the room behind the window instead of replacing it with a full-screen page.

• **One object, one clear purpose:** the label and actions match the object.

• **Compact by default:** show common actions first; use tabs or scrolling only when necessary.

• **Persistent state:** alarms, events, inventory quantities and check-offs save immediately after confirmation.

• **Visible feedback:** clocks show the saved alarm; fridge inventory and budget reflect purchases.

• **Accessible alternative:** generous touch targets, readable labels, scalable text and a list view of all objects.

Navigation

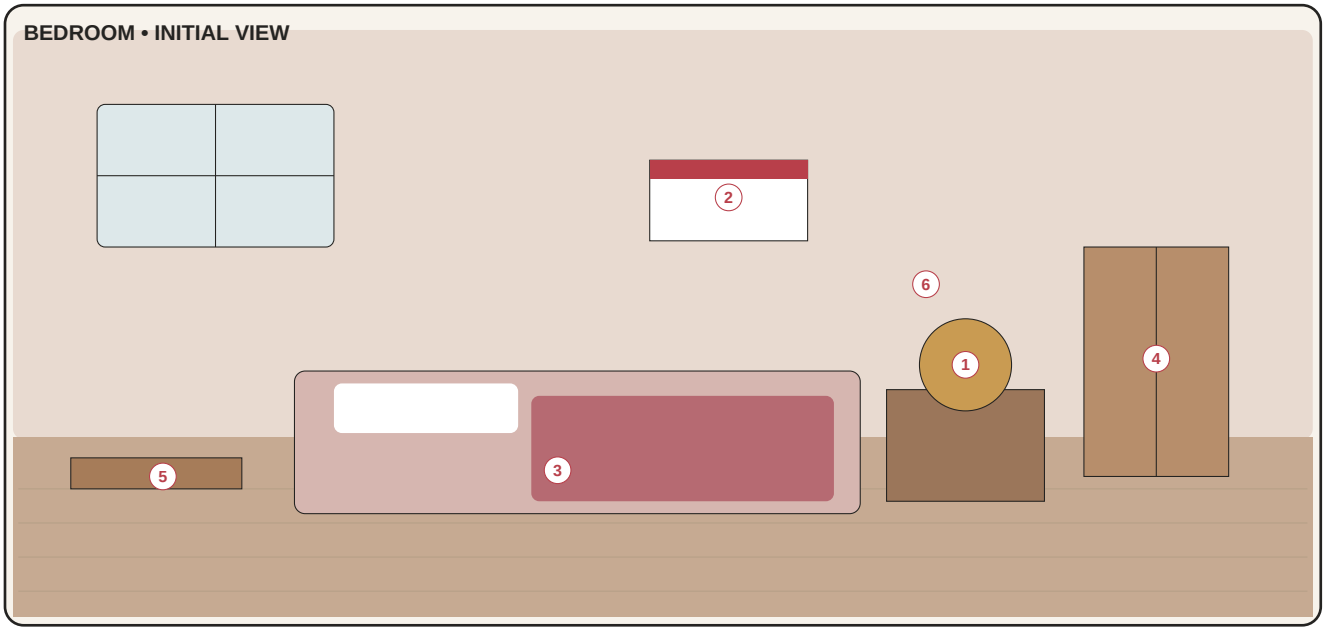

First launch opens in the bedroom. A persistent location control opens a compact map/list; selecting a destination triggers a short transition. On later launches, restore the last active location. The character stays visible in scenes and can be customised through the wardrobe or character panel.

Shared UI: location button • character • optional next-task strip • quick action • object-focus feedback • modal title/close/save • quiet autosave status.

Bedroom

First room unlocked. It introduces the game's core interaction model.

Initial room view — numbered markers indicate small interactive objects.

Interactive object map

OBJECT	FUNCTION	WINDOW CONTENT
1. Alarm clock	Set alarm time, repeat days, sound/vibration, enable or disable. The clock face updates after saving.	Time picker repeat-day toggles sound enabled switch Save
2. Wall calendar	View month/week, events, deadlines, reminders; add or edit an event.	Month/week toggle event list + Add event date/time reminder
3. Bed	Sleep routine, target bedtime and wake time, optional manual sleep log.	Bedtime wake time routine checklist Log sleep
4. Wardrobe	Browse clothing, equip an outfit, save combinations.	Character preview clothing categories Equip Save outfit
5. Desk / notebook	Homework, personal tasks, notes and project checklists.	Task title due date priority notes project checklist
6. Medication tray	Medication list and schedule, mark taken or skipped; simple history.	Medication name prescribed schedule taken/skipped history

Bedroom: object windows

Each example represents a compact modal over the dimmed room. The real scene stays visible around the panel; close returns the player to the same location and state.

1. Alarm clock

- unlocked places
- travel transition

SAVE / DONE

Implementation blueprint

Keep scene coordinates and game data separate. Each interactive object has a stable ID, room ID, position/hit area, label, action, linked data key and optional state badge. The same feature can be opened from more than one place without duplicating its logic.

Example object definition

```
{
id: "bedroom.alarm-clock",
roomId: "bedroom",
action: "open_alarm_settings",
hitArea: { x: 0.71, y: 0.39, width: 0.08, height: 0.10 },
dataKey: "alarms.primary",
feedback: "clock_face_updates"
}
```

Suggested stack

React + TypeScript for modal windows and data-driven panels; **Phaser** for interactive 2D scenes and object hit areas; **Capacitor** to package for iOS/Android. Start local-first with IndexedDB/Dexie, autosave and versioned schema migrations. Add cloud sync and external calendar/health integrations later.

Minimum acceptance criteria

- Every room opens as a full scene with furniture and decor.
- Each object has a small accurate hit area and a clear action.
- Windows overlay the room; closing returns to the same room state.
- Changes persist across navigation and app restarts.
- Systems remain linked: purchases update inventory and budget; recipes can add missing ingredients to shopping.
- A conventional accessible list offers an alternative to tapping objects.

Design status: concept and wireframe specification. Room art and modal layouts are schematic. Next step: polish room backgrounds and UI in Figma, then build one vertical slice (bedroom → alarm/calendar → persistence) before expanding to every room.
